

Integrating Environment and Economy: Progress in the 1990s

During their meeting in 1991, OECD Environment Ministers agreed that improved integration of economic and environmental decision-making was one of the key environmental challenges facing OECD governments in the 1990s. This volume provides an overview of progress achieved toward this goal during the first half of this decade. In particular, it explores the linkages between environmental policy and the agriculture, transport, and energy sectors of the economy. Special focus is also given to the interface between environmental and fiscal, trade, and employment policies. Recent developments in the analytical tools needed for assessing progress, as well as in the institutional responses to the challenge of environment-economy integration are also explored. Suggestions are then made concerning possible direction of future OECD work in this field.
